and recreational services; public management and social organizations and so on.

Average Annual Increase Rate

shows the average growth rate of social and economic development during a longer period. It can not be directly calculated by chain based growth rate. The relation is:

$$\text{Average Annual Growth Rate} = \text{Average Speed of Development} - 1$$

Average speed of development is the time series average of speed which calculated by chain based. Because the reference bases during the different periods are not same, average speed of development can not be calculated by the general method. Level approach and accumulative approach for calculating average speed of development rate are applied. The "level approach", or the method of calculating the geometric average, is derived by the formula of geometric average of the chain-based speeds of development, or comparing the level of the last year of the interval with that of the beginning year; the other is called the "accumulative approach" or the "algebraic average", "equation" method, which is derived by the summation of the actual figure of each year in the interval divided by the figure in the base year. The level approach focuses on the level of the last year, while the accumulative approach emphasizes the aggregate development in the duration.

The average annual growth rates listed in the *Yearbook* are calculated by the level approach except for the growth rate of investment in fixed assets. The base year is not listed in the duration for which average annual growth rates are computed. For instance, the average annual growth rate of the years since 1978 is shown as the average annual growth rate of 1979-2022 without showing the base year 1978.
